

Q1 at the Hotel

Hotel customers are becoming increasingly aware of their safety. The "Safe Hotels" and similar classifications can give an edge in marketing compared to less well protected hotels but it can be costly for a hotel which doesn't already satisfy the standards.

Active fire protection can be especially important for certain rooms and in such instances Q1 can be installed precisely where needed. Examples of rooms for which active fire protection can be of extra importance are handicap enabled rooms or rooms with limited escape routes.

Many hotels, B&Bs and hostels are located in old wooden houses, some with special cultural significance. For these places active fire protection should be as natural as beds.

When distributed over the number of rented out nights the additional cost of the fire protection for a room is practically negligible.

Q1 takes up little floor space and its appearance can be customized to blend into any environment. Alternatively, Q1 can be given a more spectacular appearance for those who wish to show off their active fire protection to their customers and the world in general.
